

ABSTRACT

Removable decorative wheel covers for covering central wheel portions on wheels on various types of moving vehicles from automobiles to buses to trucks to golf carts.

The covers can have perforated patterns that can be punched out as needed to allow

5 different sized wheel protrusions such as valve stems, central raised hub members, and

the like, to pass therethrough. The perforations can include a single pattern, a ring

pattern, and the like. A novel blank wheel cover can allow for customizable indicia to be

applied by various methods including stencils, peel & stick decals, static cling decals,

and/or magnetic decals to be selectively applied thereon. Another version allows for

10 removable fasteners to be on both sides of the discs so that the user can selectively make

either side of the disc visible.
